

Production Release Approval

Status: Approved for Production Release

Date: 2026-08-24

Executive Summary

The application has completed a full production-readiness review covering code quality, operational resilience, deployment health, and security hardening. The backend, admin web application, and mobile app were all validated successfully, and the live production deployment was confirmed on the VPS.

Validation Summary

The following checks were completed successfully: backend test suite passed; admin web TypeScript validation passed; admin web production build passed; mobile TypeScript validation passed; dependency audit completed with no known vulnerabilities; live production endpoints responded successfully; production deployment was validated on the live host.

Security and Hardening Summary

The application was strengthened for production deployment through fail-fast validation, rejection of insecure localhost/dev defaults in production, protection of sensitive configuration values, replay-resistant connector authentication with nonce and signature validation, dependency upgrades to secure versions, CI security scanning improvements, and deployment guidance for production use.

Operational Status

The application is live and responding successfully in the production environment. Public frontend and API endpoints are reachable and healthy, and deployment and rollback releases are possible.

Release Decision

Based on the completed quality review, security review, deployment verification, and live environment validation, this release is approved for production use.

Approval Statement

This application has met the required production readiness standards for code quality, operational reliability, deployment health, and security posture. It is approved for release and can be used in production under normal monitoring and support procedures.
